

Rigor example paper (synthetic)

A clean paper - not a real publication, generated for the Rigor demo

In a randomized study ($N = 62$), the treatment group reported higher motivation than the control group on a continuous 0-100 scale. An independent-samples t-test found a significant difference, $t(60) = 2.90$, $p = .005$.

A follow-up one-way ANOVA across the three conditions was also significant, $F(2, 59) = 5.40$, $p = .007$.

These results indicate that, in this sample, the intervention was associated with higher reported motivation. Further work is needed to test whether the effect generalizes.
